## Software Update

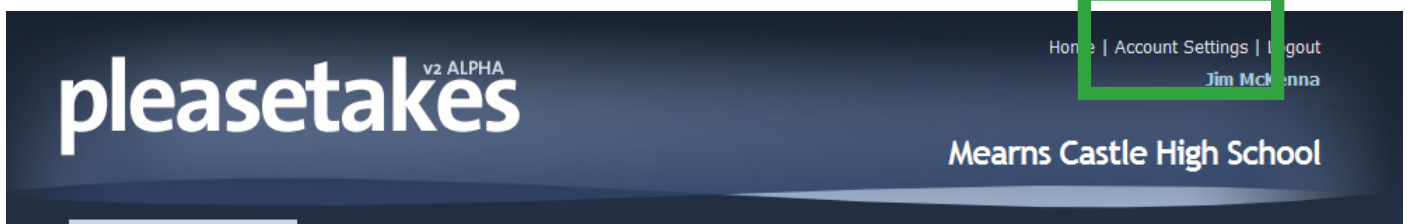

**Build:** 2010-09-08

**Update:** #0004

**Affected Assemblies:** Core

**Update Type:** Account password changing

Users may now change their account passwords. They may do so by logging in as normal. In the top right corner of any page from thereon in, the user will see an “Account Settings” option.

The user will click this, and be presented with the “Account Settings” page, containing a “Password” tab.

Like any other web application, it’s then simply a process of filling out three form fields - their old password, there for security purposes, and a new password, twice, to confirm they know their password.

All the user then has to do is click “Change” to commit changes. As long as the old password is correct, and the new passwords match, and have a length of four characters or more, there should be no problems.

If a user forgets his/her password, there will be a new feature allowing Administrators to reset it in the near future.
